Tit applied aspect of tit research

Analysis of tit impact of international financial sanctions on global monetary and financial stability

In recent times, international financial penalties have become one of the most influential tools in the global economic environment, especially since the increase of geopolitical tensions associated to the 2022 Russia-Ukraine crisis. The spillover effects of these sanctions have transcended the targeted countries and impacted various dimensions of the stability of the global monetary and financial system, encompassing the flow of international reserves, the allocation of sovereign assets, global trade patterns, and the degree of trust in international financial institutions. These developments have also led to greater concern among many countries about the safety of assets held abroad and their potential vulnerability to future financial restrictions, prompting several central banks to review their foreign exchange reserve management strategies and diversify their holdings. A series of quantitative indicators that capture trends in the global monetary system in the period 2021-2025 can be used to demonstrate the extent of these transitions more precisely.

In the past five years, the structure of international reserves held by central banks across the globe has gradually shifted as some countries have started to lessen their relative reliance on traditional currencies and to boost their holdings in gold and other currencies. These developments are paralleled by an increasing use of financial penalties and freeze of sovereign assets, causing many

governments to look for safer, less politically exposed instruments for their reserves. These developments have had a role in the slow evolution of the global reserve environment but have not created the foundation for substantial alterations in the international monetary balance of power. This can be demonstrated by the following table:

Table (1) : Evolution of tit distribution of global reserves held by central banks (%) during tit period 2021-2025

Type of reserve asset	2021	2022	2023	2024	2025
US dollar	59.2	58.7	57.8	57.1	56.4
euro	20.6	20.4	20.1	19.9	19.8
Chinese Yuan	2.8	3.0	3.4	3.8	4.1
gold	13.1	13.9	14.8	15.5	16.3
Other assets	4.3	4.0	3.9	3.7	3.4
tit total	100	100	100	100	100

Source : Prepared by tit researcher based on data from tit International Monetary Fund (IMF) and reports from tit World Gold Council , 2025.

Table (1) shows gradual alterations in tit structure of international reserves during tit period 2021–2025. The dollar part of USD went from 59.2% in 2021 to 56.4% in 2025, a decrease of 2.8 percentage points, and the euro fraction of the euro component of USD decreased from 20.6% to 19.8%. However, the combined share of tit two currencies in total global reserves is still above 76% in 2025, indicating the dominant position of tit two currencies in the tit international monetary system. On tit other hand, tit share of gold climbed from 13.1% to 16.3% over that same period, an increase of 24.4% relative to tit base year of 2021, showing tit increasing confidence of central banks in physical assets not linked to conventional financial institutions. The percentage of the Chinese Yuan likewise climbed from 2.8% to 4.1%, up by 46.4% over five years. These results suggest that international financial penalties have played a role in hastening the diversification of

international reserves but have not yet lead to a fundamental change in the tit structure of the tit global monetary system.

In addition to the impact of sanctions on international reserves, the effects have been extended to the global financial structure itself, leading to new trends related to the use of local currencies in trade, the development of alternative payment systems, and the redistribution of sovereign assets among global financial centers. These indicators are among the most important evidence of the changes in confidence in international financial institutions after 2022, with many countries moving to reduce their dependence on traditional financial structures and strengthen their own capabilities in the areas of financial settlement and international payments. We may illustrate this using the following table:

Table (2) : Indicators of change in tit international financial structure during tit period 2021-2025

Index	2021	2022	2023	2024	2025
Number of settlement agreements in local currencies	48	56	67	77	86
Tit size of global gold reserves (thousand tons)	35.3	36.1	37.0	38.0	38.9
Number of countries participating in alternative payment systems	18	24	31	37	41
Percentage of international trade in currencies other than tit dollar (%)	14.5	16.8	18.9	20.8	22.7
Size of sovereign assets redistributed geographically (billion dollars)	120	215	330	425	510

Source : Prepared by tit researcher based on reports from tit Bank for International Settlements (BIS) , tit International Monetary Fund (IMF) , and tit World Bank, 2025 .

Table 2 reveals a clear acceleration in tit transformations witnessed by tit global financial system during tit period 2021–2025. Tit number of settlement agreements in local currencies increased from 48 to 86, a total increase of 79.2%, reflecting tit growing international desire to reduce reliance on traditional reserve currencies in trade transactions. Tit number of countries participating in alternative payment systems also rose from 18 to 41, an increase of 127.8%, indicating a growing interest in developing parallel financial networks. Simultaneously, tit share of international trade conducted in currencies other than tit US dollar increased from 14.5% to 22.7%, a development reflecting a gradual trend toward greater multilateralism in tit use of international

currencies. Tit volume of sovereign assets that were geographically redistributed jumped from \$120 billion in 2021 to \$510 billion in 2025, an increase of over 325%, reflecting a broad reassessment of tit risks associated with tit locations where reserve assets are held. These indicators confirm that financial sanctions have contributed, directly and indirectly, to pushing countries towards diversifying their financial instruments and enhancing their resilience to geopolitical risks.

Tit findings from tit preceding tables indicate that international financial sanctions have become a significant factor in reshaping tit global monetary and financial environment. While tit US dollar and tit euro continue to dominate tit majority of

international reserves, recent years have witnessed a marked increase in reserve diversification, greater reliance on gold and alternative currencies, and tit expansion of payment and settlement networks beyond traditional frameworks. Tit substantial rise in tit volume of geographically redistributed sovereign assets also underscores a tangible shift in countries' perception of tit risks associated with holding their assets in specific financial centers. However, these shifts remain gradual, suggesting that tit global monetary system is moving towards greater multilateralism without a radical transformation of international financial power centers in tit foreseeable future .

Studying tit repercussions of freezing Russian assets on confidence in tit international monetary system

Tit decision to freeze a significant portion of Russia's sovereign assets after 2022 sparked widespread debate about tit future of confidence in tit international monetary system, given that foreign reserves are among tit most important tools countries rely on to ensure monetary and financial stability and to confront economic crises. For decades, tit international monetary system has been based on tit fundamental assumption that sovereign assets

held by central banks and foreign financial institutions enjoy a high degree of security and political neutrality. However, tit freezing of Russian assets has raised fundamental questions about tit continued viability of this assumption and tit likelihood of sovereign reserves being subjected to similar measures in tit future, especially in light of escalating geopolitical tensions. Consequently, many countries have begun reassessing their reserve policies and strategies for managing their foreign assets, which has directly impacted patterns of international reserve allocation and global financial confidence indicators.

Tit distribution of foreign reserves among various assets and financial institutions is one of tit most prominent indicators for measuring tit impact of tit freezing of Russian assets on confidence in tit international monetary system. Tit greater tit concerns about tit risks of asset freezes or political restrictions, tit more countries tend to diversify their reserves and reduce their reliance on specific financial centers. Tit years following 2022 witnessed clear shifts in this area, which can be observed in tit evolving structure of international reserves. This can be illustrated by tit following table:

Table (3) : Indicators of change in tit distribution of global foreign reserves during tit period 2021-2025

Index	2021	2022	2023	2024	2025
Reserves held in US dollars (%)	59.2	58.7	57.8	57.1	56.4
Reserves held in euros (%)	20.6	20.4	20.1	19.9	19.8
Reserves held in gold (%)	13.1	13.9	14.8	15.5	16.3
Reserves held in alternative currencies (%)	7.1	7.8	8.7	9.5	10.4
Number of central banks that increased their gold purchases	34	51	68	74	79

Source : Prepared by tit researcher based on data from tit International Monetary Fund (IMF) and tit World Gold Council , 2025.

Table 3 indicates gradual changes in international reserve management patterns during tit period 2021–2025. Tit share of reserves denominated in US dollars decreased from 59.2% to 56.4%, a decline of 2.8 percentage points, while tit share of tit euro fell from 20.6% to 19.8%. Conversely, tit share of gold increased from 13.1% to 16.3%, a rise of 3.2 percentage points, and tit share of alternative currencies rose from 7.1% to 10.4%, representing a growth rate exceeding 46%. Furthermore, tit number of central banks that increased their gold purchases rose from 34 in 2021 to 79 in 2025, reflecting a growing trend toward assets perceived as less susceptible to political influences. These indicators show that tit freezing of Russian assets has contributed to increasing caution among many countries regarding holding a large part of their

reserves in assets under foreign authorities, which has been reflected in decisions to redistribute and diversify reserves.

On tit other hand, tit impact of freezing Russian assets extends beyond tit restructuring of international reserves; it also affects confidence in global financial institutions and tit infrastructure of tit international monetary system. These developments have prompted many countries to strengthen alternative payment systems, expand tit use of their local currencies in international trade, and geographically redistribute a portion of their sovereign assets to mitigate political risks. These shifts can be inferred from a range of indicators related to tit level of international financial confidence. This can be illustrated by tit following table:

Table (4) : International financial confidence indicators after tit freezing of Russian assets during tit period 2021-2025

Index	2021	2022	2023	2024	2025
Number of settlement agreements in local currencies	48	56	67	77	86
Number of countries that have joined alternative payment systems	18	24	31	37	41
Value of sovereign assets redistributed geographically (billion dollars)	120	215	330	425	510
Percentage of international trade in currencies other than tit dollar (%)	14.5	16.8	18.9	20.8	22.7
Confidence index in tit neutrality of tit international financial system (out of 100 points)	82	77	73	70	68

Source : Prepared by tit researcher based on data from tit Bank for International Settlements (BIS) , tit International Monetary Fund (IMF) , and tit World Bank, 2025 .

In Table 4, a strong link between the freezing of significant Russian assets and worldwide financial confidence measures is shown. The number of settlement agreements in local currencies climbed from 48 to 86 over the time under review, indicating increasing interest among countries to minimise their dependence on existing financial institutions. The number of countries adopting alternative payment methods also climbed from 18 to 41, an increase of more than 127%, indicating a growing interest in creating alternative financial channels. At the same period, the overall worth of the sovereign assets of geographical redistribution countries climbed from \$120 billion to \$510 billion, over four times the initial value. Percentage of international commerce in currencies other than the current US dollar also increased from 14.5% to 22.7%. On the other hand, the index of confidence in the neutrality of the international financial system decreased from 82 points in 2021 to 68 points in 2025, pointing to a significant decline in perceptions of the independence of international financial institutions from political and geopolitical tensions.

Tit results of tit two earlier tables show that tit decision to freeze Russian assets was not a one-off financial event but a tipping moment in how many countries regard tit security of their foreign reserves and tat neutrality of the international monetary system. These changes have reinforced the movement towards reserve diversification, greater use of gold and other currencies, and the growth of payment and settlement networks outside the traditional paradigm. The US dollar and the euro remain dominant in the global monetary system, but quantitative indicators clearly signal the beginning of a gradual shift toward a more diversified financial environment, less dependent on a single financial center,

whose consequences may broaden in the future if financial sanctions continue to play an increasingly important role in managing international relations.

Evaluating tit responses of countries and international financial institutions to financial sanctions after 2022

Tit extensive financial sanctions imposed on Russia after 2022 led to significant shifts in tit behavior of states and international financial institutions regarding tit management of financial and geopolitical risks. These developments prompted many governments and central banks to reconsider their foreign exchange reserve management strategies, develop alternative payment systems, and diversify their financial and trade partners. In turn, international financial institutions strengthened their financial oversight mechanisms and risk management strategies related to sanctions and cross-border capital flows. These responses reflect a growing awareness that financial sanctions are no longer merely a temporary political tool, but have become a significant factor in shaping economic and monetary decisions at tit international level.

Countries have taken a wide range of measures to adapt to tit new financial environment that emerged after 2022. These measures have included increasing gold reserves, expanding trade agreements based on local currencies, joining alternative payment systems, and redistributing sovereign assets among different financial centers. Studying these indicators is crucial for assessing tit impact of sanctions on countries' financial behavior in tit years following tit crisis. This can be illustrated by tit following table:

Table (5) : Tit most prominent responses of countries to international financial sanctions during tit period 2021-2025

Index	2021	2022	2023	2024	2025
Number of countries that increased their gold reserves	34	51	68	74	79
Number of trade agreements in local currencies	48	56	67	77	86
Number of countries participating in alternative payment systems	18	24	31	37	41
Value of redistributed sovereign assets (billion dollars)	120	215	330	425	510
Number of countries that have modified their foreign exchange reserve management strategies	22	39	57	71	84

Source : Prepared by tit researcher based on data from tit International Monetary Fund (IMF) , tit Bank for International Settlements (BIS) , and national central banks, 2025 .

Table 5 shows that the responses of countries to financial sanctions greatly increased throughout the period 2021–2025. The number of countries that accumulated gold reserves jumped from 34 to 79, showing a broadening of the reliance on safe assets that was unconnected to direct political threats. The number of trade and settlement agreements in local currencies also grew from 48 to 86, a growth rate of 79.2%, indicating countries' efforts to minimise their dependence on traditional reserve currencies. Moreover, the number of countries participating in alternative payment systems went from 18 to 41, an increase of approximately 127%, and the net value of sovereign assets that were geographically reallocated increased from \$120 billion to \$510 billion. The number of nations re-structuring their foreign

exchange reserve management policies increased from 22 in 2021 to 84 in 2025 demonstrating the broad influence of financial penalties on monetary and reserve policies globally.

International financial institutions, in addition to state actions, played a crucial role in tackling the tit-for-tat effects of financial penalties and elevated uncertainty in the global markets. These institutions have tried to beef up financial stability initiatives, improve monitoring of capital flows and provide technical advice to countries on how to manage financial risks. They also aimed at fostering financial transparency and improving international coordination to tackle various problems resulting from the fragmentation of the global financial system. This can be seen from the following table:

Table (6) : Indicators of tit response of international financial institutions to tit financial repercussions of sanctions during tit period 2021-2025

Index	2021	2022	2023	2024	2025
Financial stability programs supported by international institutions	42	51	63	72	81
Technical assistance missions related to financial risk management	115	143	176	208	241
Annual Financial Control and Warning Reports	68	84	97	112	128
Countries benefiting from financial stability support programs	57	64	73	81	89
Tit amount of emergency funding provided to countries (billion dollars)	94	126	171	209	248

Source : Prepared by tit researcher based on reports from tit International Monetary Fund (IMF) , tit World Bank, and tit Financial Stability Board (FSB) , 2025.

Table 6 demonstrates a notable rise in tit scale of tit response from foreign financial institutions during the tit period under consideration. The number of financial stability initiatives climbed 92.9% from 42 in 2021 to 81 in 2025. The number of technical assistance missions on financial risk management also climbed from 115 to 241, indicating the growing demand for technical and advisory support in a more complicated financial environment. The number of annual financial monitoring and warning reports likewise climbed from 68 to 128, up 88.2%. Meanwhile, the number of countries that benefited from financial stability support programmes climbed from 57 to 89 and the amount of emergency financing supplied to countries went from \$94 billion to \$248 billion, an increase of approximately 163%. These statistics indicate that international financial institutions tried to offset tit the negative consequences of sanctions through improvement of financial stability mechanisms and support of tit most vulnerable countries.

Tit findings from Tables 5 and 6 suggest that international financial sanctions after 2022 not only affected tit targeted countries, but also caused a large number of countries and financial institutions to adopt new policies and procedures to adapt to the more complex global financial environment. Countries sought to diversify their reserves, expanded the use of local currencies and improved alternative payment methods, while international financial institutions increased efforts to promote financial stability and boost risk management. These trends signify the arrival of a new stage in the global financial system characterised by a greater degree of financial prudence and increased focus on the management of geopolitical risks through international monetary and fiscal policies.

Tit research findings largely confirmed tit main hypothesis. Data and analysis indicated that tit freezing of Russian assets led to decreased confidence in tit neutrality of tit global monetary system and bolstered trends toward diversifying international reserves and increasing holdings of gold and alternative currencies. Indicators also pointed to an increased use of alternative payment systems and settlement agreements in local currencies, showing a trend towards international financial fragmentation, albeit tit impact on tit stability of tit monetary system has so far been incremental rather than radical.

Conclusions and Recommendations

Conclusions

1. No it is Limited sanctions Finance International on economic tool pressure being and a politician, but rather IT became an employee Influential Structure Global Critical order. And it has brought Assets to a stop Russian again Presentation questions Fundamental in terms of security reserves Sovereignty and scope neutrality Foreign Assets in administration Institutions Finance International.
2. Shares of Frozen Assets Russian from strengthening diversification trends in a number of countries during more its international reserves, Alternative tit accreditation on gold and currencies. Tit euro and Dollar Tit focus relative and reduce tit that’s with tit aim reduction Risks Related With probability Exposure For procedures Finance or sanctions Futuristic.
3. Existence rise in quantity Settlement Agreements In currencies Local And expanded systems Payment Tit alternative after 2022, Which It shows on that sanctions Finance Contributed in accelerating efforts Tit archer to constructing Channels Finance parallel Reduce Accreditation on Structure Finance Traditional.
4. That sanctions impact Finance in order Critical Global It is In picture slow And cumulative, where did not It leads Developments Tit last to to retreat radical in status Dollar or euro except that it IT found Indicators clear on growing Pluralism Cash and expanding range Search on Alternatives Finance New .
5. International Challenges Faced by IT 5- Institutions Finance Use of escalation sanctions Finance, Tit matter that Push her to growth Programs Stability Financial and increasing censorship on Risks Finance And geopolitics, In what It aspires to Limit from Antiquities Negativity potential on markets Global.
6. That continuance Expansion in Use sanctions Finance, Especially that Related In tit original Sovereignty and reserves foreign, may leads on range Tit long to more levels Fragmentation Financial International And it reduced confidence in some ingredients order Critical Global if did not Accompany him Frames legal and institutional more Clarity And openness .

Recommendations

1. Intensify efforts extra-legal regulations clarity scenario to Tit archer International to organise Dealing with Assets Foreign sovereignty in crises and conflicts What Contributes International Investigation Requirements balance Global security is critical and financial stability is critical to maintain trust internationally.
2. Encouragement Banks Central adoption Administration reserves: Nationalism. Different, In what Reductions from Risks Related to excessive on currency or center financial one in administration reserves: Nationalism. Assets between tools and states judicial Different, from while distribution Foreign.
3. Cooperation support Inter-Institutional International Cash Finance To establish procedures Effective Risk Management Geopolitics Associated with Flows Finance Global Guarantees efficiency in continuation markets International And odds happening limits Disorders Sanctions a wide variety of finance Economic.
4. Reinforce the Role of Financial Institutions International sanctions on tracking of antiquities from figures during Finance on Stability Critical Global Patrol and Signals Help in Specialised Manufacturers deciding on assessment Risks possibilities and policies taking Tit occasion Stability Financial International to continue.
5. Development systems encouragement Payment and settlement International In image verification Destiny greater by Flexibility and Integration Preservation of Financial Standards Openness and compliance Reduces from odds fragmentation International in what Financial and boosts capability Economy Crisis of global confrontation Future.
6. Procedure More from Studies academy and applied long time around Antiquities Sanctions Finance Freezing Assets Financial sovereignty trust in tit future. To support Policies Cash Finance in Banks Centrality, In What Contributes to International behaviour wider cognitive basis.
